Q.2. Compare India data with any five countries.

Answer.

The following table compares India with five countries on different parameters using latest available data.

Country	Population (2024)	GDP (2024) (Trillion US$)	GDP per capita (US$)	Life expectancy (years)
India	1.45 billion	3.91	2,695	72
China	1.41 billion	18.74	13,303	78
USA	340.1 million	28.75	84,534	79
Japan	124.0 million	4.03	32,487	84
Germany	83.5 million	4.69	56,104	81
Brazil	212.0 million	2.19	10,311	76

Comparison and Conclusion :-

1) India has the largest population among these six countries.
2) India recorded the highest GDP growth rate (6.5% in 2024) among these countries.
3) However, India's GDP per capita is much lower than USA, Germany, Japan, China and Brazil.
4) Life expectancy in India (72 years) is also lower than all five countries.
5) This shows that while India has a large and fast-growing economy, there is still substantial room for improvement in income per person and living standard indicators.

Q1. Methods to control e-waste.

Answer.

E-waste means discarded electronic items such as computers, phones, TVs, batteries, and other electronic devices.

The main methods to control e-waste are:

1) Reduce - Buy electronic products only when necessary and choose durable devices.

2) Reuse - Repair, upgrade, donate, or sell old electronics instead of throwing them away.

3) Recycle - Send e-waste to authorized recycling centres so useful materials like copper, aluminium, and gold can be recovered.

4) Proper disposal - Never mix electronic waste with normal household garbage. Use designated e-waste collection centres.

5) Manufacturer take-back - Companies can collect old products from customers for safe recycling or disposal.

6) Create awareness - Educate people about the harmful effects of improper e-waste disposal and correct recycling methods.

7) Government regulations - Enforce e-waste management rules and ensure manufacturers and recyclers handle waste responsibly.

8) Safe handling - Batteries and electronic components containing toxic substances should be handled separately to prevent soil, water, and air pollution.

In short: The best way to control e-waste is to follow the 3Rs - Reduce, Reuse, and Recycle.
